I've tried several downloads and installations but the drivers.Q: Any way to get prototype.js to distinguish between methods and field access with arguments? I'm trying to replace all of my prototypes using prototype.js. However, I also want it to be able to determine the difference between real properties and methods. Basically, is there any way to make it distinguish between:

```
var A = function() { var myAttribute = {}; var myMethod = function() {}; this.attribute = myAttribute; this.attribute.property = 'value'; this.attribute.method = function() {}; } A.prototype.attribute = {property: 'value'}; vs
var A = function() { var myAttribute = {}; var myMethod = function() {}; this.attribute = myAttribute; this.method = function() {}; } A.prototype.attribute = {property: 'value'}; A.prototype.method = function() {};
```

Both of these will allow the property to get modified: `a = new A(); a.attribute.property = 'new value';` but the method will still throw an error `a.attribute.method();` and call "myMethod()" Do I just need to do this manually for each of my objects? Seems like there should be a more elegant way to handle this... `var A = function() { var myAttribute = {}; var myMethod = function() {};` // Possibly need to check to see if we've modified the // prototype object, and if so, what constructor we're // calling `var type = new /`

This download software (driver) for Intel® Desktop Board 1501 can be further downloaded from Intel® Corporation web site. Intel is a trademark of Intel Corporation in the United
